ICT-based solutions applied across the manufacturing process chain help to make manufacturing efficient. They enable a more personalized, diversified and mass-produced product portfolio and a flexible reaction to market changes.

The European strategy on smart specialization aims to strengthen the competitive advantages of EU regions in terms of ICT skills, R&D capability, industrial output and infrastructures while linking up similar strategies at regional and national levels, and offering incentives for growth and differentiation.

The project 3DCentral creates a network between innovative enterprises, R&D institutions and public authorities across different regions of Central Europe.

The participants of this event can learn from best practices, experience future technologies and initiate new cooperation. In the afternoon individual consultings are offered by selected experts.

Target groups:

Manufacturing companies, ICT companies, innovative service companies, Research & Development institutions, public authorities
